The Effects of a Total Task Chaining, Music, & Visual Aid Intervention on Handwashing Performance

Damari Moore, Emma Dempsey, & Dr. Kayla Jenssen, Ph.D.

Introduction

- Personal hygiene is an essential skill for greater independence, access to the community, when building relationships, & in employment (McClannahan et al., 1990)
- Handwashing reduces the spread of many diseases and conditions such as respiratory and diarrheal infections (CDC, 2024)
- Necessary during key times, such as during food preparation or consumption, when ill or in contact with someone who is ill, after contact with human or animal waste, and when treating wounds (CDC, 2024)

Project:

• **Purpose**: Evaluate the effects of total task chaining, music, and a visual aid on the accuracy, duration, and quality of handwashing.

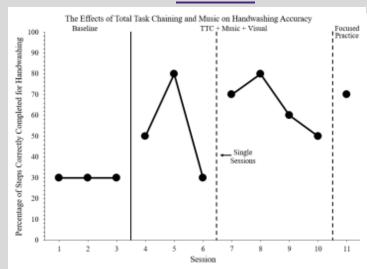

• Participant:

 5-year-old boy diagnosed with ASD receiving services in an early intervention program

• <u>Setting:</u>

 Bathroom utilized during regular service delivery (shower, toilet, sink, mirror, & paper towel.

Results:

Methods:

-Procedures:

- Glo Germ gel and UV light were used to simulate and visualize handwashing quality
- Task analysis developed based on handwashing steps
 CDC recommendations

Before Sample

After Sample

- Baseline
 - Instructed to wash hands
 - No feedback or assistance provided
- Intervention
 - Total task chaining plus prompts
 - Visual posted displaying picture of each handwashing step
 - Muscular timer to guide 20-second scrubbing duration
- **<u>Discussion:</u>** Environmental distractions & having multiple sessions within a day may have influenced performance. Further data needed & replication.
